IdeaDB PWA Product Requirements Document

An idea database PWA lets users capture, organize, and track ideas offline across web and mobile, replacing tools like Excel with structured search, tags, and status updates. Core functionality focuses on quick CRUD operations, full-text search, and PWA essentials like installability and local storage.[1] [2] [3] [4] [5]

Overview

IdeaDB is a progressive web app for personal idea management, targeting developers and creators like you who juggle concepts in software, investing, or projects. It solves Excel's limits—poor search, no offline sync, rigid structure—by offering a responsive, local-first database with tags and priorities.[6] [3] [4] [1]

Goals

- Enable fast idea capture anytime, with offline editing and auto-sync.
- Provide intuitive organization via tags, status, and filters to surface actionable items.
- Deliver native-like experience: installable, fast, works on iOS/Android/desktop.[2] [5]

Target Users

Busy tech professionals (e.g., software devs in Stockholm) tracking AI ideas, stock strategies, or PWAs.[user-information] Needs: quick entry during commutes, mobile search, export to CSV for analysis.

Core Features

Feature	Description	Priority
Idea CRUD	Add/edit/delete ideas with fields: title, description, tags, status (new/in-progress/done), priority (high/medium/low), date, notes/links. Rich text support. [3] [4] [1]	Must-have
Search & Filter	Full-text search; filter by tags, status, date range, priority. Autocomplete tags. [4] [7]	Must-have
Dashboard	List view, stats (ideas by status/month), sortable grid. [4] [8]	Must-have
Offline Support	IndexedDB storage, service worker caching, sync on reconnect. [2] [5] [6]	Must-have
Export/Import	CSV/JSON export; Excel import for migration. [1]	Should-have

PWA Requirements

- Manifest for app install, icons (192x192+), theme colors.
- Service worker: cache-first strategy for UI/assets, network-first for sync.
- Responsive: mobile-first, dark mode toggle.[9] [2]

Non-Functional Requirements

- Performance: Load <2s, Lighthouse PWA score 90+.[2]
- Storage: Persistent IndexedDB quota request.
- Security: Local-only data; optional password-protect DB.
- Tech: React/Vue + IndexedDB (or RxDB), no backend MVP.[5] [6]

User Flows

1. Open app → Dashboard shows recent ideas.
2. Tap + → Quick-add form (title/tags/status) → Saves offline.
3. Search "AI PWA" → Filters results → Edit/tag inline.
4. Online → Auto-sync if cloud enabled later.

Success Metrics

- 90% ideas captured offline.
- User retention: Daily opens after week 1.
- Lighthouse audits pass all PWA criteria.[2]

Risks & Assumptions

- Browser storage limits: Mitigate with quota checks.
- No auth MVP: Data local; add later for multi-device.[4]
- Scope: MVP in 1-2 weeks with your React/PWA skills.[user-information]
